

Addendum to the Sky Ripper Systems 54mm instruction manual.

Important:

- 1) The supply bottle nitrous pressure at the time the motor is filled should be no lower than 600psi, and no higher than 800psi. for the Sky Ripper Systems 54mm hybrid motor. Steps *must* be taken to keep the pressure within this range, and as close to 700psi as possible.
- 2) There is a new fill tube wrapping procedure; Wrap a layer of electrical tape starting 1/2 inch below the lower face of the injector, and stopping 2" before the end of the fill tube *before* you attach the igniter to it. Attach the igniter with a *second* wrap of electrical tape as shown in the instruction manual and video.
